Introduction

The amended federal Safe Drinking Water Act (SDWA) requires state agencies which are responsible for regulating public water systems to prepare and submit to the Environmental Protection Agency (EPA) an annual report on public water system violations. The 1996 Annual Compliance Report was the first report required under the amended SDWA and this 1998 report is the third. Also as a requirement of the SDWA, EPA is to summarize and evaluate the states' reports in an annual national report, the next national report should be released around July 1, 1999.

EPA established the Public Water System Supervision (PWSS) Program under the authority of the 1974 Safe Drinking Water Act and the 1986 and 1996 amendments. The SDWA allows states and territories to seek EPA approval to administer their own PWSS Programs. The authority to run a PWSS Program is called primacy. To receive primacy, states must meet certain requirements laid out in the SDWA and the regulations, including the adoption of drinking water regulations that are at least as stringent as the Federal regulations and a demonstration that they can enforce the program requirements. The Missouri Department of Natural Resources' Public Drinking Water Program (PDWP) has had primacy since the late 1970's. The PDWP, with its primacy authority, administers the federal standards and requirements in Missouri through equivalent state regulations.

The Missouri Public Water System Universe

A Public Water System (PWS) is defined as a system that provides water through piping or other constructed conveyances for human consumption to at least 15 service connections or serves an average of at least 25 people for at least 60 days each year. Water testing at systems serving fewer people than this is facilitated by local and county sanitarians and the Missouri Department of Health, rather than DNR. There are three types of PWSs. PWSs can be community (such as towns, subdivisions, or mobile home parks), non-transient non-community (such as schools or factories) or transient non-community systems (such as rest stops or parks). The requirements for construction, operation, monitoring, etc., vary among systems based on their type, size, and source of water.

The time period covered by this annual Compliance report is calendar year 1998. In 1998, there were 2,714 active PWSs in Missouri. Of this total, 1,436 were community, 234 were non-transient non-community and 1,044 were transient non-community systems.

The community water systems in Missouri served approximately 4.7 million citizens in 1998. These citizens benefit from one of Missouri's most outstanding resources - its water. There is generally a good quantity of good quality water in Missouri. By far the largest source of water for Missourians was the Missouri and Mississippi River system. The abundant supply of water in these rivers and the proximity to the state's major population centers make the use of the big rivers as a source so popular. Ground water is the next most used source of drinking water for Missouri's community supplies. This is especially true in southern Missouri where good quality groundwater is easy to obtain and requires very little treatment to be used as a drinking water source.

Analysis of Compliance by Public Water Systems in 1998

We expect a lot from our public water systems and require testing for as many as 90 different regulated chemicals and microbiological contaminants during the year. A system is to be applauded for performing all required testing and meeting all MCL standards. When MCL violations do occur, it can be the first step in correcting a problem: that of identifying it. Many public water systems perform testing beyond that required by the state.

The Summary of Violations tables are counts of individual violations. Because there are multiple regulations involved and some monitoring is on a monthly schedule, each Public Water System (PWS) has the potential to accumulate multiple violations during the year. For example, the monitoring requirements for the Total Coliform Rule alone create a potential for over 32,000 violations. This puts some perspective on the violation figures shown in the tables. Another factor is the number of systems that have violations. Many of the violations are from water systems with problems which result in multiple violations during the year while other systems may only have one or two violations. The department uses various methods to focus in on the water systems that need attention.

The Missouri Department of Natural Resources and the Environmental Protection Agency use a process called Significant Non-Compliers or SNCs to focus attention on the water systems with problems that are considered significant. These are the systems with serious violations potentially affecting public health or multiple monitoring violations.

During 1998 there were only 83 systems on the SNC list. That means that 2,631 of the 2,714 PWSs in Missouri were not significant violators.

The violations representing the most potential impact on public health (MCLs, lead action levels, and treatment techniques) were identified in only a small number of the public water systems.

The vast majority of MCL and monitoring violations were for failure to meet the requirements of the Total Coliform Rule. Total coliform bacteria serve as an indicator that disease-causing organisms may be present and all public water systems in the state must test for this type of bacteria every month they dispense water to the public. The number of major monitoring violations decreased from 1,202 in 1997 to 1,143 in 1998. A number of systems missed collecting samples for one or two months; relatively few systems missed sampling for three or more months.

The number of MCL violations of the Total Coliform Rule, however, increased significantly in 1998. MCL violations for total coliform bacteria increased from 373 in 1997 to 555 in 1998. MCL violations for fecal coliform or *E. coli* bacteria increased from 37 in 1997 to 81 in 1998. One explanation for this is that bacteria are more prolific in warmer weather and the mild winter

of 1997-98 allowed bacteria to persist. DNR's monitoring effort is paying off by finding these public water systems with major bacteriological problems. To put the problem in perspective, 68 out of the 2,714 public water systems in the state had a total of 81 acute violations for fecal coliform or *E. coli* in 1998. So while these acute violations can be serious, they are rare. Additional good news is that for most of these violations, there were no reports of illness. A possible reason for this is that microorganisms were not present in large enough numbers to cause infection in most people.

Some people, however, may be more vulnerable to water-borne illness than the general population. To educate the public on this issue, the U.S. Environmental Protection Agency will require all community water systems to provide their customers with their first Consumer Confidence Report by October 19, 1999 covering calendar year 1998. Each report must include the following warning: "Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA and CDC (Centers for Diseases Control) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791."

The phrase "know before you go" can apply to domestic as well as foreign travel, as compliance with drinking water regulations was significantly worse than average for transient non-community systems, so named because they do not typically serve the same people on a daily basis. This type of water system includes restaurants, resorts and campgrounds with their own wells. Transient non-community systems in 1998 accounted for 38 percent of all water systems in the state, but had 48 percent of the MCL violations for total coliform bacteria, 65 percent of the acute violations for fecal coliform or *E. coli*, and 58 percent of major monitoring violations.

Water districts, a type of community system, had as a group a record much better than average. In 1998, water districts accounted for 9 percent of all public water system in the state, but had only 4 percent of the MCL violations for total coliform bacteria, 2 percent of the acute violations for fecal coliform or *E. coli* and 2 percent of the major monitoring violations.

Compliance Activities - Preserving the Quality of the Drinking Water

The Missouri Department of Natural Resources (DNR) works closely with violators to return them to compliance in a timely manner. This includes phone contacts, on-site inspections, meetings with owners or operators and technical assistance as needed. For the more serious violations, a bilateral compliance agreement between the water system owner and DNR is the tool generally used to move the system back into compliance. Should a water system fail to meet the provisions of that agreement or continue to violate drinking water regulations, more formal enforcement actions, such as legal action through the courts, may become necessary. The following formal actions in 1998 represent action on more serious problem systems.

Bilateral Compliance Agreements signed	63
Cases referred to the Attorney General	10
Settlement Agreement/Judgements	3
Cases Pending at End of 1998	12

The DNR also provides training and technical assistance to try to prevent the occurrence of microbiological violations. Training is routinely provided to operators and owners of public water systems around the state, primarily concentrating on the basic principles of running a water system and avoiding microbiological contamination of the system. Technical assistance in the form of phone contacts and on site visits is also provided routinely or upon request to help water system operators avoid or correct problems. Most of these activities are carried out by staff in the six Division of Environmental Quality regional offices. The following highlights from the regional offices are typical of the scope of effort for public drinking water.

St. Louis Regional Office – 224 unsafe bacteria samples investigated
Jefferson City Regional Office - 68 drinking water complaints investigated
Southeast Regional Office – 215 inspections of water system facilities

For all violations, public water systems are required to notify the consumers they serve. The method of notification varies by the violation and system type. Systems must then report back to DNR how the public notice was performed. Some violations, such as the confirmed detection of fecal coliform bacteria or *E. coli*, warrant more immediate action due to the threat to public health. For such acute violations, DNR requires systems to immediately notify their customers to boil their water before consumption. Boil water orders remain in effect until the problem has been corrected, and the water is safe to consume.

Violations Table

State: Missouri

Reporting Interval:

Jan. 1, 1998-Dec. 31, 1998

	MCL (mg/λ) ¹	MCLs		Treatment Techniques		Significant Monitoring/Reporting	
		Number of Violations	Number of Systems With Violations	Number of Violations	Number of Systems With Violations	Number of Violations	Number of Systems with Violations

2. Number of major monitoring violations for sanitary survey under the Total Coliform Rule.

Definitions for Summary of Violations Table

The following definitions apply to the Summary of Violations table.

Filtered Systems: Water systems that have installed filtration treatment [10 CSR 60-4.055].

Inorganic Contaminants: Non-carbon-based compounds such as metals, nitrates, and asbestos. These contaminants are naturally-occurring in some water, but can get into water through farming, chemical manufacturing, and other human activities. DNR has established MCLs for 15 inorganic contaminants [10 CSR 60-4.030].

Lead and Copper Rule: This rule established national limits on lead and copper in drinking water [10CSR 60-15.010]. Lead and copper corrosion pose various health risks when ingested at any level, and can enter drinking water from household pipes and plumbing fixtures. States report violations of the Lead and Copper Rule are reported for the following six categories:

Initial lead and copper tap M/R: A violation where a system did not meet initial lead and copper testing requirements, or failed to report the results of those tests to the State.

Follow-up or routine lead and copper tap M/R: A violation where a system did not meet follow-up or routine lead and copper tap testing requirements, or failed to report the results.

Treatment installation: Violations for a failure to install optimal corrosion control treatment system or source water treatment system which would reduce lead and copper levels in water at the tap. [One number is to be reported for the sum of violations in both categories].

Lead service line replacement: A violation for a system's failure to replace lead service lines on the schedule required by the regulation.

Public education: A violation where a system did not provide required public education about reducing or avoiding lead intake from water.

Maximum Contaminant Level (MCL): The highest amount of a contaminant that DNR allows in drinking water. MCLs ensure that drinking water does not pose either a short-term or long-term health risk. MCLs are defined in milligrams per liter (parts per million) unless otherwise specified.

Monitoring: DNR specifies which water testing methods the water systems must use, and sets schedules for the frequency of testing. A water system that does not follow DNR's schedule or methodology is in violation [10 CSR 60-4.010].

States must report monitoring violations that are significant as determined by the EPA Administrator and in consultation with the States. For purposes of this report, significant monitoring violations are major violations and they occur when no samples are taken or no results are reported during a compliance period.

A major monitoring violation for the surface water treatment rule occurs when at least 90% of the required samples are not taken or results are not reported during the compliance period.

Organic Contaminants: Carbon-based compounds, such as industrial solvents and pesticides. These contaminants generally get into water through runoff from cropland or discharge from factories. DNR has set legal limits on 54 organic contaminants that are to be reported [10CSR 60-4.040 and 4.100].

Radionuclides: Radioactive particles, which can occur naturally in water or result from human activity. DNR has set legal limits on four types of radionuclides: radium-226, radium-228, gross alpha, and beta particle/photon radioactivity [10 CSR 60-4.060]. Violations for these contaminants are to be reported using the following three categories:

Gross alpha: A violation for alpha radiation above MCL of 15 picocuries/liter. Gross alpha includes radium-226 but excludes radon and uranium.

Combined radium-226 and radium-228: A violation for combined radiation from these two isotopes above MCL of 5 pCi/L.

Gross beta: A violation for beta particle and photon radioactivity from man-made radionuclides above 4 millirem/year.

Surface Water Treatment Rule: The Surface Water Treatment Rule establishes criteria under which water systems supplied by surface water sources, or ground water sources under the direct influence of surface water, must filter and disinfect their water [10 CSR 60-4.055]. Violations of the “Surface Water Treatment Rule” are reported for the following categories:

Monitoring, routine/repeat (for filtered systems): A violation for a system’s failure to carry out required tests, or to report the results of those tests.

Treatment techniques (for filtered systems): A violation for a system’s failure to properly treat its water.

Total Coliform Rule (TCR): The Total Coliform Rule establishes regulations for microbiological contaminants in drinking water. These contaminants can cause a short-term health problem. If no samples are collected during the one-month compliance period, a significant monitoring violation occurs. States are to report four categories of violations:

Acute MCL violation: A violation where the system found fecal coliform or E. Coli, potentially harmful bacteria, in its water, thereby violating the rule.

Non-acute MCL violation: A violation where the system found total coliform in samples of its water at a frequency or at a level that violates the rule. For systems collecting fewer than 40 samples per month, more than one positive sample for total coliform is a violation.

For systems collecting 40 or more samples per month, more than 5% of the samples positive for total coliform violation.

Major routine and follow-up monitoring: A violation where a system did not perform any monitoring. [One number is to be reported for the sum of the violations in these two categories.]

Sanitary Survey: A major monitoring violation if a system fails to collect 5 routine monthly samples if sanitary survey is not performed/

Treatment Techniques: A water disinfection process that EPA requires instead of a MCL for contaminants that laboratories cannot adequately measure. Failure to meet other operational and system requirements under the Surface Water Treatment and the Lead and Copper Rules have also included in this category of violation for purposes of this report.

Unfiltered Systems: Missouri has required filtration of all surface water sources for many years. There are no unfiltered surface systems in Missouri and therefore no violations in this category.

Violation: A failure to meet any state or federal drinking water regulation.

Variances and Exemptions

Variances and exemptions are compliance tools used to ensure public water systems in violation of MCL standards return to compliance in a framework that protects the public health while allowing public water systems needed flexibility in solving a complicated problem. A variance is typically used when feasible technology or other means does not exist for a system to meet a regulation. Missouri, however, has not yet needed to use the variance as a compliance tool. An exemption is used to allow public water systems adequate time to evaluate the best available technology and other strategies to meet an MCL. Over the past several years, DNR has used the exemption to solve the problem of atrazine MCL exceedences at a number of surface water systems. In order for DNR to issue an exemption, these water systems typically had to commit a rigorous schedule of both additional treatment at the water plant (involving significant costs) and watershed management, a coordinated effort of educating farmers who apply atrazine in the watershed of the drinking water source water.

DNR granted one exemption in 1998 to the city of Bucklin. This system initially exceeded the MCL for atrazine in 1997, but the violation technically continued into 1998. Since the health concern with atrazine is long-term, rather than acute, calculation for compliance with the MCL is based on the average of the four most recent quarterly samples. First and second quarter 1998 results for atrazine were 1 part per billion (ppb) for each quarter, well below the MCL of 3 ppb for atrazine. However, atrazine levels of 9 and 5 ppb in the third and fourth quarter 1997, kept the running annual average at 4 ppb, in exceedence of the MCL. Rather than issue additional notices of violation, DNR pursued the exemption route with Bucklin to ensure the system in the future would be reliably and consistently in compliance with the MCL through treatment at the water plant and implementation of pesticide best management practices in the watershed of the Bucklin's drinking water impoundment. The exemption issued to Bucklin in 1998 will run until August 17, 1999. No atrazine was detected in samples collected during the third and fourth quarters of 1998 and first quarter 1999, so this system has already returned to compliance.

For Further Information

Information regarding the contents of this report or related data on Missouri's public water systems can be obtained from the Missouri Department of Natural Resources, Public Drinking Water Program, P.O. Box 176, Jefferson City, MO 65102. Call (573) 751- 5331. You can also visit our website at <http://www.dnr.state.mo.us/deq/pdwp/homepdwp.htm>.

APPENDIX A

Listing of Maximum Contaminant Level (MCL) violators for 1998.

1. Coliform MCL Violations

Acute

The following systems were under boil water orders due to acute MCL violations for fecal coliform or E. coli bacteria for the months listed. These acute violations also violate the standard for total coliform bacteria.

APPENDIX C

Major Repeat Monitoring Violations

The following systems had major repeat monitoring violations for the months listed. A major repeat monitoring violation occurs when a routine sample tests positive for total coliform bacteria and a system then fails to submit any follow-up, or repeat, samples as required.

County	SUPPLY NAME	ID#	Month(s)
BARRY	AYER'S CORNER SHOPPING CENTER	MO5291423	July
